

Troubleshooting: PhantomCacheDrift Alert

This document is a synthetic test fixture used to verify the v4m-mcp RAG ingestion pipeline. It is not a real SAS Viya Monitoring alert or procedure.

When the PhantomCacheDrift alert fires, it indicates that the internal test sentinel value ZORKMID-9931 has drifted out of its expected range. To resolve it, restart the fixture-cache component and confirm the sentinel value returns to ZORKMID-9931 within five minutes. If the search_docs tool can retrieve this paragraph by searching for "PhantomCacheDrift" or "ZORKMID-9931", the live PDF drop-in path is working end to end.
